to enact appropriate responses knowing cognitive behavioral social and neural constraints that may affect the security enterprise will undoubtedly result in a more effective deployment of existing human and technological resources studying how inter observer variability human factors and biology may affect the security agenda and the usability of existing security technologies is of great economic and policy interest in addition brain sciences may suggest the possibility of novel methods of surveillance and intelligence gathering this is just one example of a typical security issue that may be fruitfully tackled from a neuroscientific and interdisciplinary perspective the objective of our research topic was to document across relevant disciplines some of the most recent developments ideas methods and empirical findings that have the potential to expand our knowledge of the human factors involved in the security process to this end we welcomed empirical contributions using different methodologies such as those applied in human cognitive neuroscience biometrics and ethology we also accepted original theoretical contributions in the form of review articles perspectives or opinion papers on this topic the submissions brought together researchers from different backgrounds to discuss topics which have scientific applicative and social relevance
