problems and solutions in structural geology and tectonics volume 5 in the series developments in structural geology and tectonics presents students researchers and practitioners with an all new set of problems and solutions that structural geologists and tectonics researchers commonly face topics covered include ductile deformation such as strain analyses brittle deformation such as rock fracturing brittle ductile deformation collisional and shortening tectonics thrust related exercises rift and extensional tectonics strike slip tectonics and cross section balancing exercises the book provides a how to guide for students of structural geology and geologists working in the oil gas and mining industries provides practical solutions to industry related issues such as well bore stability allows for self study and includes background information and explanation of research and industry jargon includes full color diagrams to explain 3d issues

this is the solution guide accompanying the book chemistry for geologists and environmental scientists each question is addressed and answered here geologists and environmental scientists all must take general chemistry for most students this is just a hurdle to pass before graduation however chemistry provides a tool set that many geologists and environmental scientists can use to better solve problems they face in their day to day activities this book comes as a result of teaching an undergraduate course in geology specifically aimed at low temperature geochemistry it is presented at a junior senior level and could be termed gen chem for geologists like general chemistry the course does not delve deeply into the background of why for some parts of thermodynamics and calculus is used only briefly with the expectation that students interested in these subjects can work later to improve their knowledge in these fields that said the book demonstrates why chemistry is useful to geologists and environmental scientists for a rough book outline the book focuses first

on introductory material what is geochemistry review water acids and bases then delves into some problem solving with geochemistry thermodynamics redox rate laws radioactivity isotopes and then introduces the applications of these problem solving methods to geology the geology environmental subjects covered include water rock interactions metasomatism weathering etc groundwater geochemistry biogeochemistry and even planetary science each chapter is followed up with 2 10 problems to be solved for practice the solution guide will be posted separately geochemistry tends to be approached in college as a senior graduate level course this book approaches it from a junior level and is one of the first to attempt to do so students should be ready for this course material after having taken gen chem and 2 3 geology courses chemistry is a dry subject especially for geologists and environmental scientists as such the book attempts to inject some humor by adding a few comics here and there the comics may be described as bizarre more than anything else but probably work for the material being covered i did not have a large production budget for this book total budget 0 the figures are crude and or are hand drawn or are taken from the public domain nasa gov or are my own photos for some this may be a turn off but for others these may hold students attention better

how underwater mediation has transformed deep sea spaces into resource rich frontiers green energy technologies such as windmills solar panels and electric vehicles may soon depend on material found at the seabed how did a space once imagined to be empty and unfathomable come to be thought of as a treasure trove of resources lisa yin han traces how contemporary developments in underwater sensing and imaging materially and imaginatively transmogrify the ocean bottom into a resource frontier capable of sustaining a digitally connected global future set against the backdrop of climate change energy transition and the expansion of industrial offshore extractions deepwater alchemy looks at oceanic media and its representation of the seabed in terms of valuable resources from high tech simulations to laboratories and archives that collect and analyze sediments han explores the media technologies that survey visualize and condition the possibility for industrial resource extraction introducing the concept of extractive mediation to describe the confluences between resource prospecting and undersea knowledge production moving away from anthropocentric frameworks she argues that we must equalize access to deep ocean mediation and include the submerged perspectives of multispecies communities from the proliferation of petroleum seismology to

environmental impact research on seabed mining to the development of internet enabled seafloor observatories deepwater alchemy shows us that deepwater mediation is entangled in existential hopes and fears for our planetary future as the ocean bottom becomes increasingly accessible to people han prompts us to ask not whether we can tame the seafloor but rather why and for whom are we taming it

headlines continue to blare news of climate change tangential catastrophic events and dwindling energy resources written by respected practitioners and geared to practitioners and students environmental hydrogeology second edition explores the role that hydrogeology can play in solving challenging environmental problems new in the second edi

introduces the principles and concepts of hydrogeology for the advanced undergraduate or dual graduate undergraduate levels stresses application of mathematics to problem solving and use of case studies includes student versions of flownet a program to generate cross sectional flow nets aqtesolv program to evaluate pumping test data to determine aquifer parameters quickflow an analytical model to simulate two dimensional steady state transient ground water flow in a horizontal plane
