texts it emphasizes using heuristics for solving difficult optimization problems important in business practice by making best use of methods from computer science and operations research furthermore case studies and examples illustrate the real world applications of these methods the authors supply examples in excel gams matlab and opl the metaheuristics code is also made available at the book s website in a documented library of python modules along with data and material for homework exercises from the beginning the authors emphasize analytics and de emphasize representation and encoding so students will have plenty to sink their teeth into regardless of their computer programming experience

this unique book provides a collection of more than 200 mathematical problems and their detailed solutions which contain very useful tips and skills in real analysis each chapter has an introduction in which some fundamental definitions and propositions are prepared this also contains many brief historical comments on some significant mathematical results in real analysis together with useful references problems and solutions in real analysis may be used as advanced exercises by undergraduate students during or after courses in calculus and linear algebra it is also useful for graduate students who are interested in analytic number theory readers will also be able to completely grasp a simple and elementary proof of the prime number theorem through several exercises the book is also suitable for non experts who wish to understand mathematical analysis

comprehensive textbook reference applies mathematical methods and modern symbolic computational tools to anisotropic elasticity presents unified approach to a vast diversity of structural models state of the art solutions are provided for a wide range of composite material configurations including 3 d anisotropic bodies 2 d anisotropic plates laminated and thin walled structures

pricing or benchmarking is a process of evaluating the performance of a financial company s products and services or systems against other businesses considered to be at the top of their field by applying a measurement of best in performance this book includes contributions from the leading global experts in the field who tackle topics such as whether the islamic financial system has been dependent on the libor euribor in its benchmarking exercises to date and thus whether it will be affected negatively by the predicted non existence of the libor euribor from 2021 onwards they also address the question of whether the islamic financial system requires benchmarking of its products and services and

consider the emergence of sharī ah justified benchmarking in today s islamic financial system additionally they look at how benchmarking formulas should be adapted to ensure the satisfaction of customers within the principles of maqasid al sharī ah it takes a legal and institutional approach to the subject which readers will find particularly valuable as there are various forms of islamic finance institutions that do not conform to established models in the finance industry furthermore there are emerging business models that will benefit from this line of investigation this book offers a timely analysis of these issues and redresses the existing misconceptions and misinterpretations pertaining to benchmarking in an islamic finance context and as such provides guidance and strategies for future directions it will appeal to researchers of islamic banking finance and insurance as well as practitioners particularly standard setting bodies regulators and policy makers

at the turn of the twentieth century the french mathematician paul painlevé and his students classified second order nonlinear ordinary differential equations with the property that the location of possible branch points and essential singularities of their solutions does not depend on initial conditions it turned out that there are only six such equations up to natural equivalence which later became known as painlevé i vi although these equations were initially obtained answering a strictly mathematical question they appeared later in an astonishing and growing range of applications including e g statistical physics fluid mechanics random matrices and orthogonal polynomials actually it is now becoming clear that the painlevé transcendents i e the solutions of the painlevé equations play the same role in nonlinear mathematical physics that the classical special functions such as airy and bessel functions play in linear physics the explicit formulas relating the asymptotic behaviour of the classical special functions at different critical points play a crucial role in the applications of these functions it is shown in this book that even though the six painlevé equations are nonlinear it is still possible using a new technique called the riemann hilbert formalism to obtain analogous explicit formulas for the painlevé transcendents this striking fact apparently unknown to painlevé and his contemporaries is the key ingredient for the remarkable applicability of these nonlinear special functions the book describes in detail the riemann hilbert method and emphasizes its close connection to classical monodromy theory of linear equations as well as to modern theory of integrable systems in addition the book contains an ample collection of material concerning the asymptotics of the painlevé functions and their various applications which makes it a good reference source for everyone working in the theory and applications of painlevé equations and related areas
