the fields of integer programming and combinatorial optimization continue to be areas of great vitality with an ever increasing number of publications and journals appearing a classified bibliography thus continues to be necessary and useful today even more so than it did when the project of which this is the fifth volume was started in 1970 in the institut fur okonometrie und operations research of the university of bonn the pioneering first volume was compiled by claus kastning during the years 1970 1975 and appeared in 1976 as volume 128 of the series lecture notes in economics and mathematical systems published by the springer verlag work on the project was continued by dirk hausmann reinhardt euler and rabe von randow and resulted in the publication of the second third and fourth volumes in 1978 1982 and 1985 volumes 160 197 and 243 of the above series the present book constitutes the fifth volume of the bibliography and covers the period from autumn 1984 to the end of 1987 it contains 5864 new publications by 4480 authors and was compiled by rabe von randow its form is practically identical to that of the first four volumes some additions having been made to the subject list

efficiency in public and freight transportation systems is of great importance for a society railways can offer high capacity and relatively low environmental impact but require that several technical systems are tuned and operate well specifically there is a tight interdependency between infrastructure and trains the consequences are that all subsystems must be maintained and that the coordination of infrastructure activities and train operations is essential railway infrastructure maintenance and train services should ideally be planned together but practice and research about railway scheduling has historically focused mainly on train operations and timetabling while maintenance planning has received less attention and little research have considered the joint scheduling of both types of activities instead the traditional approach has been a sequential and iterative planning procedure where train timetabling often has precedence over infrastructure maintenance this thesis studies how maintenance windows which are regular time windows reserved for maintenance work can be dimensioned and jointly scheduled with train services in a balanced and efficient way for both maintenance contractors and train operators mathematical methods are used with the aim of advancing the knowledge about quantitative methods for solving such coordination problems the thesis contributes with new optimization models that jointly schedule maintenance windows and train services investigates the solving efficiency of these models and studies crucial extensions of the planning problem primarily for the consideration of maintenance resources furthermore the models are applied to verified and validated on a demanding real life problem instance the main results are that integrated and optimal scheduling of maintenance windows and train services is viable for problems of practical size and importance and that substantial maintenance cost savings can be achieved with such an integrated approach as compared to a traditional

sequential planning process the thesis consists of an introduction and overview of the research followed by six papers which present 1 a cost benefit model for assessment of competing capacity requests at a single location 2 an optimization model for integrated scheduling of both maintenance windows and train services 3 mathematical reformulations that strengthen the optimization model 4 extensions for handling resource considerations and cyclic schedules 5 a case study for a major single track line in sweden and 6 a mathematical study of length restricted sequences under cyclic conditions

this is the second part of a major theoretical work by patrik schumacher which outlines how the discipline of architecture should be understood as its own distinct system of communication autopoeisis comes from the greek and means literally self production it was first adopted in biology in the 1970s to describe the essential characteristics of life as a circular self organizing system and has since been transposed into a theory of social systems this new approach offers architecture an arsenal of general comparative concepts it allows architecture to be understood as a distinct discipline which can be analyzed in elaborate detail while at the same time offering insightful comparisons with other subject areas such as art science and political discourse on the basis of such comparisons the book insists on the necessity of disciplinary autonomy and argues for a sharp demarcation of design from both art and engineering schumacher accordingly argues controversially that design as a discipline has its own sui generis intelligence with its own internal logic reach and limitations whereas the first volume provides the theoretical groundwork for schumacher s ideas focusing on architecture as an autopoeitic system with its own theory history medium and its unique societal function the second volume addresses the specific contemporary challenges and tasks that architecture faces it formulates these tasks looking specifically at how architecture is seeking to organize and articulate the complexity of post fordist network society the volume explicitly addresses how current architecture can upgrade its design methodology in the face of an increasingly demanding task environment characterized by both complexity and novelty architecture s specific role within contemporary society is explained and its relationship to politics is clarified finally the new global style of parametricism is introduced and theoretically grounded

environment behavior studies for healthcare design explains how environment behavior eb studies can contribute to healthcare design research and explores how evidence based theories can be applied and integrated into the healthcare design practice drawing on eb theories and the latest research in environment behavior studies this book shows how the healthcare environment can positively impact patients and caregivers well being and healthcare organization s efficiency by modifying environmental attributes such as space configuration color lighting signage acoustics and artwork it addresses a range of healthcare facilities including children s hospitals long term care acute care and outpatient care facilities and uses a range of evidence based design research methods such as interviews focus groups observations surveys and space syntax the author also explains how research evidence and evidence based design can be

integrated into healthcare design more cohesively in a redefined design process this book provides a solid conceptual structure that informs a clear map for understanding the eb theories and their applications in healthcare design this research guide for healthcare design helps students academics designers and architects reconsider how to create environments that support patients healing and well being whilst considering efficiency and safety

this contributed volume presents a collection of materials on supply chain management including industry based case studies addressing petrochemical pharmaceutical manufacturing and reverse logistics topics moreover the book covers sustainability issues as well as optimization approaches the target audience comprises academics industry managers and practitioners in the field of supply chain management being the book also beneficial for graduate students

architecture has attracted increasing worldwide attention in recent years not only because of its cultural significance but also because of concern over the performance and resource implications of buildings 101 in depth articles by international scholars and practitioners bring the subject into focus by examining issues from various viewpoints please contact your representative for a leaflet detailing full contents and contributors it also includes sample pages and several illustrations from the book

integer programing is one of the most fascinating and difficult areas in the field of mathematical optimization due to this fact notable research contributions to integer programming have been made in very different branches of mathematics and its applications since these publications are scattered over many journals proceedings volumes monographs and working papers a comprehensive bibliography of all these sources is a helpful tool even for specialists in this field i initiated this compilation of literature in 1970 at the institut fur konometrie und operations research university of bonn since then many collaborators have contributed to and worked on it among them dipl math claus kastning has done the bulk of the work with great perseverance and diligence he has gathered all the material and checked it with the original sources the main aim was to incorporate rare and not easily accessible sources like russian journals preprints or unpublished papers without the invaluable and dedicated engagement of claus kastning the bibliography would never have reached this final version for this reason he must be considered its responsible editor as with any other collection this literature list has a subjective viewpoint and may be in some sense incomplete we have however tried to be as complete as possible the bibliography contains 4704 different publications by 6767 authors which were classified by 11839 descriptor entries

the paper presents an in depth computational comparison of the basic solution algorithms for solving transportation problems the comparison is performed using state of the art computer codes for the dual simplex transportation method the out of kilter method and the

primal simplex transportation method often referred to as the row column sum method or modi method in addition these codes are compared against a state of the art large scale lp code ophelie lp the study discloses that the most efficient solution procedure arises by coupling a primal transportation algorithm embodying recently developed methods for accelerating the determination of basis trees and dual evaluators with a version of the row minimum start rule and a modified row first negative evaluator rule the resulting method has been found to be at least 100 times faster than ophelie and 6 times faster than a streamlined version of the share out of kilter code the method's median solution time for solving 1000 x 1000 transportation problems on a cdc 6600 computer is 17 seconds with a range of 14 to 22 seconds author
