it is important for every physicist today to have a working knowledge of einstein s theory of general relativity introduction to general relativity published in 2007 was aimed at first year graduate students or advanced undergraduates in physics only a basic understanding of classical lagrangian mechanics is assumed beyond that the reader should find the material to be self contained the mechanics problem of a point mass constrained to move without friction on a two dimensional surface of arbitrary shape serves as a paradigm for the development of the mathematics and physics of general relativity special relativity is reviewed the basic principles of general relativity are then presented and the most important applications are discussed the final special topics section takes the reader up to a few areas of current research an extensive set of accessible problems enhances and extends the coverage as a learning and teaching tool this current book provides solutions to those problems this text and solutions manual are meant to provide an introduction to the subject it is hoped that these books will allow the reader to approach the more advanced texts and monographs as well as the continual influx of fascinating new experimental results with a deeper understanding and sense of appreciation

this book contains detailed solutions of all the 606 exercises of my book general relativity simplified assessed these exercises represent an integral part of the original book as they fill many gaps and provide essential extensions and elaborations

this comprehensive student manual has been designed to accompany the leading textbook by bernard schutz a first course in general relativity and uses detailed solutions cross referenced to several introductory and more advanced textbooks to enable self learners undergraduates and postgraduates to master general relativity through problem solving the perfect accompaniment to schutz s textbook this manual guides the reader step by step through over 200 exercises with clear easy to follow derivations it provides detailed solutions to almost half of schutz s exercises and includes 125 brand new supplementary problems that address the subtle points of each chapter it includes a comprehensive index and collects useful mathematical results such as transformation matrices and christoffel symbols for commonly studied spacetimes in an appendix supported by an online table categorising exercises a maple worksheet and an instructors

manual this text provides an invaluable resource for all students and instructors using Schutz's textbook

this book is about the general theory of relativity which is concisely labeled as general relativity the book is the result of a rather extensive view to the literature of this theory over most of its lifetime reflecting various stages of its development the book contains 129 solved problems as well as 606 exercises whose detailed solutions are published in another book that accompanies the present book the book also includes a detailed index and many cross references the book can be used as an introduction to general relativity at undergraduate and graduate levels unlike most other books on general relativity which are mostly dedicated to the presentation justification application and validation of the formalism of the theory and hence rather minor attention is usually paid to the interpretation and epistemology of the theory this book is primarily interested in the interpretative and epistemological aspects of the theory

this volume is made up of papers presented at the conference on classical general relativity held at the city university london in december 1983 new tests arising from space experimentation pulsars and black holes have revitalised the study of Einstein's theory of gravitation classical general relativity nineteen contributors survey recent progress and identify future avenues of research

the currents of interest deep discussion that stemmed from a paper published in 1935 of Einstein Podolsky Rosen which continue unabated to this day are very much in evidence in this volume along with the great works of Bohr Schrodinger Heisenberg Born others it stands at the foundations of our thinking on the quantum theory poses a serious challenge to its claim to completeness

writing a new book on the classic subject of special relativity on which numerous important physicists have contributed and many books have already been written can be like adding another epicycle to the Ptolemaic cosmology furthermore it is our belief that if a book has no new elements but simply repeats what is written in the existing literature perhaps with a different style then this is not enough to justify its publication however after having spent a number of years both in class and research with relativity I have come to the conclusion that there exists a place for a new book since it appears that somewhere along the way mathematics may have obscured and prevailed to the degree that we tend to teach relativity and I believe theoretical physics simply using heavier mathematics without the inspiration and the mastery of the classic physicists of the last century moreover current trends encourage the application of techniques in producing quick results and not tedious conceptual approaches resulting in long lasting reasoning on the other hand physics cannot be done a la carte stripped from philosophy or to put it in a simple but dramatic context a building is not an accumulation of stones as a result of the above a major aim in the writing of this book has been the distinction between the mathematics of Minkowski space and the physics of relativity

based upon the proceedings of the first international conference on the history of general relativity held at Boston University's Osgood Hill Conference Center North Andover Massachusetts 8-11 May 1986 this volume brings together essays by twelve prominent historians and philosophers of science and physicists the topics range from the development of general relativity John Norton John Stachel and its early reception Carlo Cattani Michelangelo De Maria Anne Kox through attempts to understand the physical implications of the theory Jean Eisenstaedt Peter Havas and to quantize it Peter G Bergmann to elaborations of the theory into a unified theory of electromagnetism and gravitation Vladimir P Vizgin Michel Biezunski and considerations of its cosmological extensions Pierre Kerszberg George F R Ellis this is the first volume to survey many of the most important questions in the history of general relativity with many of the contributions drawing upon such original resources as the Einstein Archive it is hoped that it will stimulate much needed further research in this hitherto neglected area
