this book reviews the existing data on the frequency and distribution of injuries and the factors contributing to injuries in adventure and extreme sports further it suggests injury prevention strategies and provides recommendations for future research providing the first comprehensive compilation of epidemiological data over a range of new age sports considered to be adventurous and extreme this publication is also the first of its kind to track down all of the major literature associated with the topic a uniform and evidence based approach to organizing and interpreting the literature is used in all chapters all of the sport specific chapters are laid out with the same basic headings making it easier for the reader to find common information across chapters sports physicians physical therapists recreation managers researchers injury prevention specialists the adventure and extreme sport industry and the adventure and extreme sport participants themselves will find the book useful in identifying problem areas in which appropriate preventive measures can be initiated to reduce the risk and severity of injuries they will also want to use the book as a source for future research related to injuries in adventure and extreme sports

covers basic diving physiology the pathophysiology of decompression sickness maritime toxicology assessment of fitness for diving special considerations for female elderly and pediatric divers diving related problems in people with pre existing medical conditions such as pulmonary cardiac and neurologic disease and much more with new chapters on the kinetics of inert gas marine poisoning and intoxication and diabetes and diving

heat flow estimates at two sites on the u s atlantic continental margin are presented an estimate of the heat flowing from the basement also has been obtained about 4 8 km of sediments penetrated at the cost b 2 and 4 0 km at the cost b 3 were deposited since the upper jurassic well logs were used to evaluate thermal gradients and sedimentation rates whereas thermal conductivities and radiogenic heat productions were measured on drill cuttings samples a procedure to estimate in situ thermal conductivity from drill cuttings and well logs is described a substantial set of samples in the form of drill cuttings were sorted in four major lithologies sandstones siltstones shales and limestones laboratory measurements of density porosity

thermal conductivity quartz potassium uranium ppm and thorium ppm were performed on 128 reorganized and pulverized samples a significant correlation of the matrix thermal conductivity to quartz and potassium content was found in situ porosity and volume fraction of each lithology determined mainly from well logs were used to calculate in situ mean thermal conductivity finally the mean in situ vertical component of the thermal conductivity as required for heat flow values has been estimated from a correction factor for the anisotropy of each lithology the in situ temperature and anisotropy effects substantially decrease estimates of thermal conductivity at depth below the uppermost 1 km in both wells the best estimate of the thermal gradient is 26.3 °C km⁻¹ at cost b 2 and 26.1 °C km⁻¹ at cost b 3 whereas in situ mean thermal conductivities range between about 1.8 and 1.9 W m⁻¹ K⁻¹ the average heat flow is estimated as about 45 mW m⁻² at cost b 2 and 44 mW m⁻² at cost b 3 with an uncertainty of about 20-25% the mean radiogenic production in sediments at the two sites has been estimated as 1.83 cost b 2 and 1.44 cost b 3 10⁻⁶ W m⁻³ with a 12-14 km thick sedimentary sequence a radioactive contribution of 20-25 mW m⁻² can be expected the effects of sediment deposition compaction pore water advection and radiogenic heat production have been combined in a numerical model hutchison 1985 to estimate the undisturbed basement heat flux although the sedimentation depresses the basement heat flux by 15-20% this effect is more than compensated by radioactive heat production in the sediments so that the surface flux is estimated to be higher than that from the basement the latter is calculated at about 33-39 mW m⁻² a relatively low value the overall uncertainty is about 20-25% and other estimates on continental margins with thick sediments e.g. reiter and jessop 1985 probably have at least a similar uncertainty
